COMPANY PROFILE

Listed Company

Full Range

Whole Industrial Chain

- History: More than 40 years experience of manufacturing pumps since 1982
- Scale: Cover an area of up to 170000 Square meters, have nearly 1000 employees
- Technology: A group of professional technical engineers and a strong R&D team
- Management: Scientific ERP management and strict quality control system
- Equipments: Japanese automatic molding machine & pouring machine for cast iron parts, double spindle lathe for pump body and stator, Japanese CNC precision automatic lathe for shaft, automatic wiring machine, electrophoresis, etc.
- Innovations: Continuously diversify products range to satisfy customers' demands
- Production capacity: 200,000 pcs/month
- Marketing network: America, Europe, Asia, Africa, etc;
- Long-term supplier of world-class companies: GAZI and main supermarkets in USA etc;
- NEW: Professional technology development and production group for controller PCB board

RoHS TÜV CE  ISO9001 ISO14001 ISO45001

FRAMEWORK OF SIX BUSINESS UNITS

40⁺
40 years
of pump industry

4
Russia, Vietnam, North
America, Indonesia

150⁺
More than 150 export
countries

700⁺
More than 700 types and
models of water pumps

LEADING TECHNOLOGY AND PRODUCTION PROCESS

Build core power of competitiveness
Enhance added value of innovation

80⁺
R & D Personnel

The company following a quality first path by strictly implementing the theory of “Market oriented, innovation, quality and customer satisfaction” to get a lot of certificates, such as ISO9001 (Quality Management System), ISO14001 (Environmental Management System), ISO45001:2018(Occupational Health and Safety Management System) as well as CE, CSA certificates and so on in order to adapt the demand of national markets.

86⁺
National Patent

It has an international and systematic R & D team led by doctors and senior engineers, implements a talent training mechanism of "introducing and going out", combines production, learning and research with universities and colleges in Zhejiang University, and carries out research on new energy, new materials and new technologies.

TD

In-line Circulating Pump

Technical Parameters

Flow rate: 8-900m³/h
Head range: 11-85m
Power range: 0.75-200kW

Application

HVAC system
Cooling system
Domestic hot water system
Industrial liquid transportation
Water supply system
District heating system

● Working Confitions

The TD type single stage pipeline circulation pump is equipped with a standard motor and mechanical seal. Compared to similar types of products, the structure of these products is less susceptible to impurities in the pumped liquid. The product design is a detachable form that can be pulled out from the top, which can repair the pump without affecting the pipeline system. Among them, the TD32-TD150 caliber products have an extended shaft structure, while the TD200-TD300 caliber products have a detachable structure. The detachable structure adopts a containerized mechanical seal, and there is no need to disassemble the motor when replacing the mechanical seal.

- Full-enclosed air-blast two-pole standard motor
 - four-pole standard motor.
 - Protection level: IP55
 - Insulation level: F
- Standard voltage: 50Hz: 1x220-230/240V
3x200-220/346-380V
3x220-240/380-415V

The product is suitable for conveying thin, clean, non corrosive, non flammable and explosive liquids that do not contain solid particles, fibers, or liquids with physical and chemical properties similar to water. When used in situations where the liquid is viscous or dense, it can cause a decrease in the pump characteristic curve and an increase in energy consumption.

Maximum working pressure:
12 bar for conventional models; Special type 16bar
Liquid temperature: -15°C to 110°C
Ambient temperature: maximum+40°C
Altitude: maximum 1000m

Rotation direction: clockwise (looking down at the motor blade end)

● Application

TD pump is a multi-purpose product that can transport various media from self operated liquids, mainly used as liquid transportation and circulation equipment.
For example:

District heating system (the water quality in the heating system should meet recognized water quality standards)

- HVAC system
- Cooling system
- Domestic hot water system
- Industrial liquid transportation
- Water supply system

● Minimum Inlet Pressure NPSH

In case that the pressure in pump is lower than the steam pressurc used to convey liquid, the cavitations will occur. To avoid cavitations, a minimum pressure at the inlet side of the pump shall be guaranteed. The maximum suction stroke can be calculated with following formula:

$H = P_b \times 10.2 - NPSH - H_f - H_v - H_s$
Pb=atmosphere pressure [bar](can be sct as 1bar)
In a closed system, Pb means system pressure [bar]
NPSH=Net positive suction head [m]
(It can be read out from the point of possible max.flow rate shown on NPSH curve)
Hf=Pipeline loss at the inlet[m]
Hv=Stcam prcssure[m]
Hs=Safely margin=Minimum 0.5m delivery head
If the calculated result II is positive, the pump may run under the max. Suction stroke H.
In case the calculated result II is negative, a delivery head of min. Inlet pressure is necessary

● Minimum Inlet Pressure NPSH

Connecting several pumps in parallel running will ben-efit much more than running a single large pump.

Applicable to different working states necessary in variable flow system.

Increasing the possibility of water supply when the pump is in failure. Because in case of pump failure, only part of the system flow is effected.

● Installation Conditions

The product has different installation requirements, and the specific installation requirements are as follows.

1. The system pipeline has the ability to support the pump, and pumps equipped with <2.2kW motors can be directly suspended in the pipeline.
2. For pumps equipped with a 2.2kW motor, they can be installed horizontally or vertically on the working pipeline. For pumps equipped with a 2.2kW motor, they must be installed perpendicular to the horizontal direction in the working pipeline. (Figure 2-A)
3. The installation of the pump should ensure that the tension of the system pipeline should not be transmitted to the pump body during use.
4. To ensure the normal operation of the motor, the pump should be installed in an environment with sufficient cooling, and the temperature of the cooling air should not exceed 40°C.
5. If the pump is installed outdoors, it must be equipped with a suitable cover to prevent water ingress or condensation of electrical components.
6. In order to facilitate inspection and maintenance of the pump, sufficient space must be left above and below the pump. When the pump supporting motor is less than 5.5kW, a minimum of 300mm should be left, and when the pump supporting motor is ≥5.5kW, a minimum of 1000mm should be left. (Figure 2-B).
7. In order to prevent noise and vibration and ensure optimal operation, the pump should be installed with a vibration damping base. Generally, a cement base is used, and the weight of the base should be 21.5x the weight of the pump. (Figure 2-C)
8. To meet the different needs of customers, TD32-TD150 products are divided

Installation of pumps with motor power<2.2kW

Installation of pumps with motor power>2.2kW

Picture 2-A

Installation of pumps with motor power<5.5kW

Installation of pumps with motor power≥5.5kW

Picture 2-B

Picture 2-C

● PRODUCT STRUCTURE AND COMPONENT MATERIAL

The design of the pump is pump and motor. Pump part can be pulled out.
The TD series are equipped with standard motor and mechanical seal.
Motor is TEFC standard motor. Its major dimensions are in conformity with JB/T8680 standard.
The pump body is equal to a section of pipeline.
While in maintenance, blind flange can be used to seal to pump cover which enable the normal operation of pumps.
The flange connection dimension are in conformity with the related provisions PN16 in GB/T 17241.6 or ISO7005-2/DIN2501.
The inlet and outlet diameters are in conformity with related standard dimensions.
The pump head is to connect motor and the pump. "O"ring is used to seal the pump head and the pump.
See Table 4 for component materials.

● Performance Curve

● Curve Conditions

- The following instructions apply to the performance curve shown later:
- The curve tolerance complies with ISO9906:2012, Grade 3B.
 - All curves are based on 3x380V, and the measured values of the motor at constant speeds of 2900rpm, 1480rpm, or 1450rpm.
 - The test medium is clean water with a temperature of 20°C and no solid impurities or air.
 - The use of pumps refers to the performance range of the bold curve to prevent overheating caused by low flow and motor overload caused by excessive flow.
 - If the viscosity or density of the pumped liquid is different from that of water, the motor performance must be adjusted.
