## 9.1 GENERAL INFORMATION

### 9.1.1 Specific features

- (1) Less refrigerant charge amount due to use of double phase refrigerant flow system. The total refrigerant charge amount has been reduced by more than 50%.
- (2) The indoor outdoor interconnection signal wiring has been done away with. The microcomputer chip is installed in the indoor unit. There is no need for the unit to communicate between the outdoor and indoor units so the unit is more resistant to electromagnetic noise thus the incidence of microcomputer malfunction has been reduced. The compressor in the outdoor unit has its own self protection function, that reacts according to abnormal high pressure and excessive high temperature.
- (3) There are only four power lines between the outdoor and indoor unit. As no signal wire is used there is no need to separate the power line from the signal line. One cable with 4 wires encased in one sheath is enough for conducting the wiring work between the outdoor unit and the indoor unit. This contributes to simpler wiring work in the field.
- (4) All air supply ports have auto swing louvers. The indoor fan motor has two speeds of high and low.
- (5) All models have service valves protruding from the outdoor unit for faster flare connection work in the field.

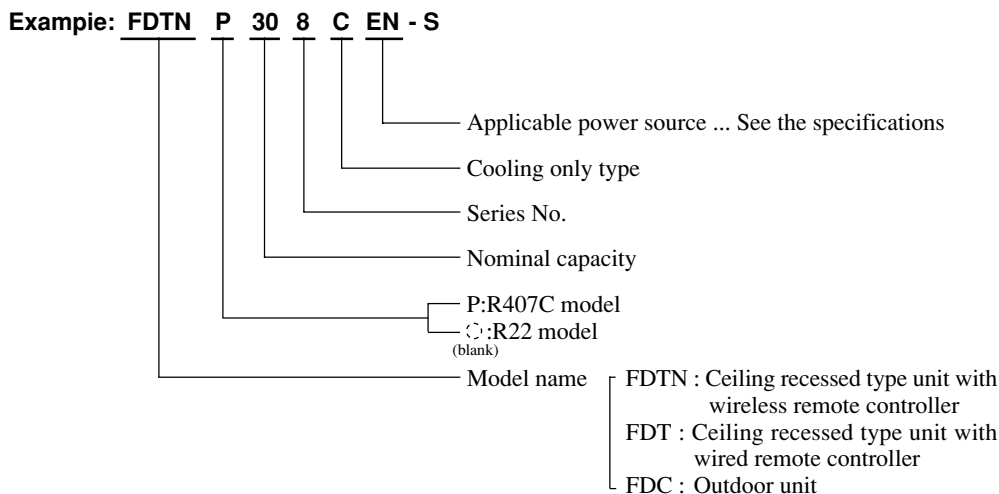

**(6) Low sound level**

Operating noise has been remarkably reduced due to adoption of the crescent turbo fan which cuts off wind-blowing noise and also console type of cabinet which is highly effective to protect vibration.

**(7) 700mm high drain head**

Adoption of drain pump with high drain head and high capacity (600cc/min) has made it possible to have maximum 700 mm (from below ceiling drain head. [In case 700mm drain head is required, set it up close to the unit. It is impossible to do piping on down slope.]

(2) Correction of cooling capacity in relation to air flow rate control (fan speed)

Coefficient: 1.00 at High, 0.95 at Low

**(3) Correction of cooling capacity in relation to one way length of refrigerant piping**

It is necessary to correct the cooling capacity in relation to the one way equivalent piping length between the indoor and outdoor units.

Note (1) Equivalent piping length can be obtained by calculating as follows.

208, 258, 308 series [φ15.88(5/8")]: Equivalent piping length = Real piping length + (0.10 × Number of bends in piping)

408, 508, series [φ19.05(3/4")]: Equivalent piping length = Real piping length + (0.15 × Number of bends in piping)

[Equivalent piping length < Limitation length of piping + 5m]

**(4) When the outdoor unit is located at a lower height than the indoor unit in cooling operation,** the following values should be subtracted from the values in the above table.

Height difference between the indoor unit and outdoor unit in the vertical height difference	5m	10m	15m
Adjustment coefficient	0.01	0.02	0.03

**Piping length limitations**

Item	Model	FDT208, 258 FDTNP208, 258 type	FDT308~508 type	FDTNP308~508 type
Max.one way piping length		30m		50m
Max.vertical height difference		20m(Outdoor unit is higher) 15m(Outdoor unit is lower)	15m	30m(Outdoor unit is higher) 15m(Outdoor unit is lower)

Note (1) Values in the table indicate the one way piping length between the indoor and outdoor units.

**How to obtain the cooling capacity**

**Example :** The net cooling capacity of the model FDT308CEN-A with the air flow “High”, the piping length of 15m, the outdoor unit located 5m lower than the indoor unit, indoor wet-bulb temperature at 19.0 °C and outdoor dry-bulb temperature 35 °C is

$$\text{Net cooling capacity} = \frac{7100}{\text{FDT308CEN-A}} \times \frac{1.00}{\text{Air flow "High"}} \times \frac{(0.98 - 0.01)}{\text{Length 15m. Height difference 5 m}} \times \frac{1.0}{\text{Factor by air temperatures}} = \mathbf{6887 \text{ w}}$$

## 9.2.7 Noise level

Notes (1) The data are based on the following conditions.

Ambient air temperature:

Indoor unit 27°C DB, 19°C WB.

Outdoor unit 35°C DB.

### Indoor unit

Measured based on JIS B 8616

Mike position as below

### Outdoor unit

Measured based on JIS B 8616

Mike position: at highest noise level  
in position as below

Distance from front side 1 m

Height 1 m

(2) The data in the chart are measured in an anechoic room.

(3) The noise levels measured in the field are usually higher than the data because of reflection.

### (1) Indoor unit

Models **FDTN208C**  
**FDT208-A**

Noise level 38 dB (A) at HIGH  
33 dB (A) at LOW

Models **FDTN258C**  
**FDT258-A**

Noise level 39 dB (A) at HIGH  
35 dB (A) at LOW

Models **FDTN308C**  
**FDT308-A**

Noise level 41 dB (A) at HIGH  
35 dB (A) at LOW

Models **FDTN408C**  
**FDT408-A**

Noise level 48 dB (A) at HIGH  
40 dB (A) at LOW

Models **FDTN508C**  
**FDT508-A**

Noise level 49 dB (A) at HIGH  
43 dB (A) at LOW

### (2) Outdoor unit

Model **FDC208CEN3**

Noise level 52 dB (A)

Model **FDC258CEN3**

## **9.4 OUTLINE OF OPERATION CONTROL BY MICROCOMPUTER**

Except for function relating to heating, same at the unit for FDT(N) heat pump type. See page 317.

## **9.5 APPLICATION DATA**

The application data for the cooling only models are similar to those for the heat pump models. (See page 332.)

## **9.6 MAINTENANCE DATA**

Same at the cooling /heating equipment FDT(N) heat pump type. Refer to page 348.
